Hierarchical Clustering of Alzheimer's Diagnostic Groups
Standardised signed degree centrality (DC_z)

cells are the MEAN DC_z of the subjects in each diagnostic group (n = 20/20/20/16/20/20), standardised across the six groups per ROI (ddof = 1)
groups clustered by correlation distance + average linkage over the 246-D profile; ROIs by euclidean distance + average linkage

clinical progression order: CN -> SMC -> EMCI -> MCI -> LMCI -> AD

bootstrap stability of the branches (1000 resamples of subjects within groups): {CN,SMC} 49%; {LMCI,AD} 26%; {CN,SMC,EMCI} 19%

Descriptive only. Branch heights are distances, not p-values. No ROI x stage test in this project reaches q < 0.05.
