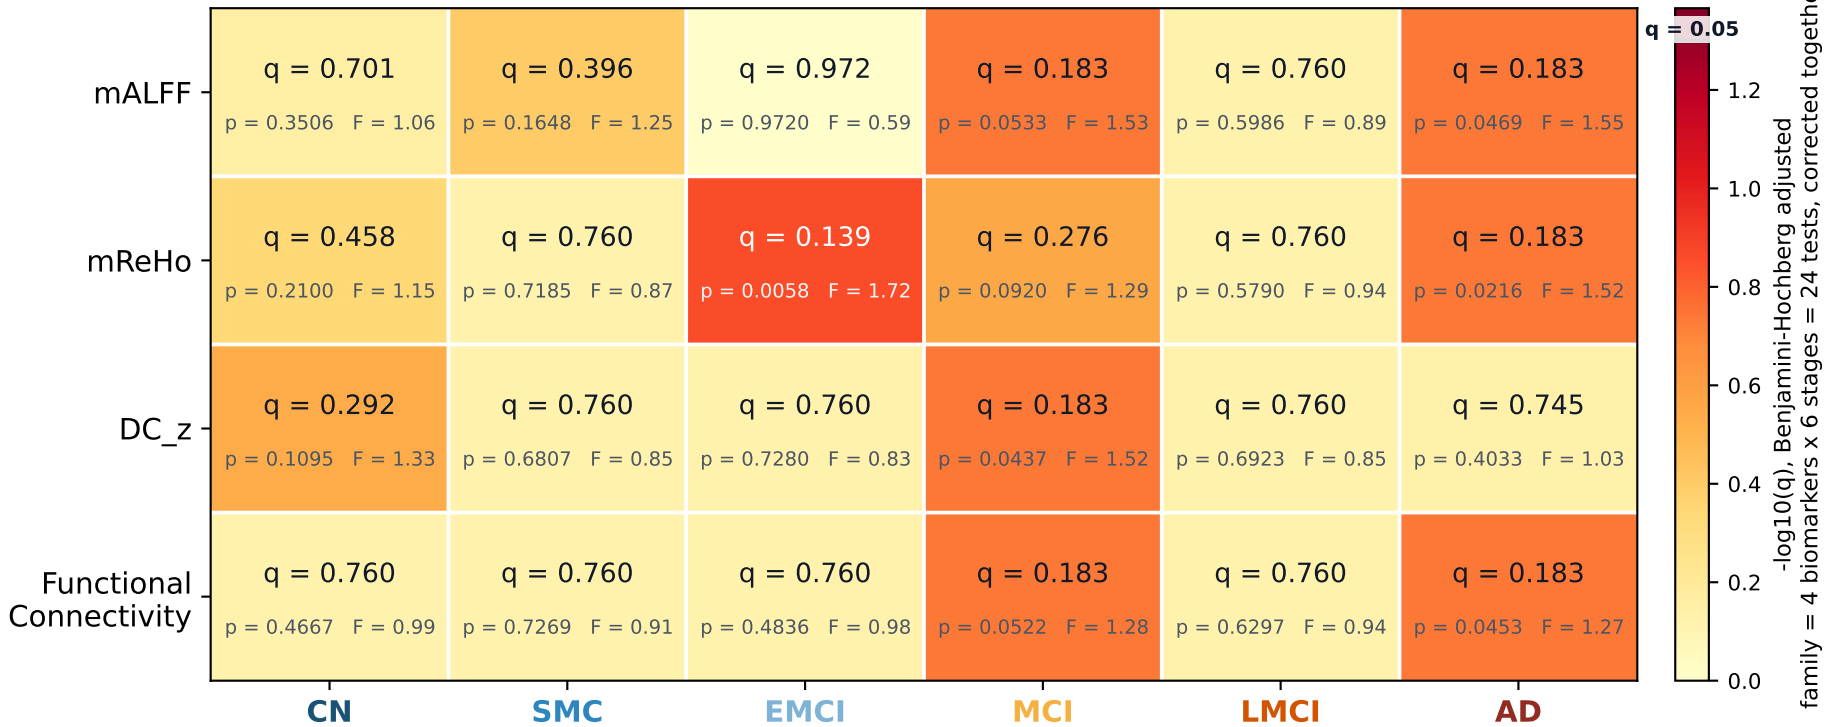
Stage-Level Multivariate Significance by Biomarker and Stage

distance-based pseudo-F, two-group permutation test (9,999 permutations) on all 246 ROIs jointly
cells show the FDR-adjusted q-value, with the raw p and the pseudo-F statistic beneath



disease stage (one-vs-rest: this stage versus the pooled other five)

no biomarker-stage combination reaches q < 0.05 (0 of 24 tests; smallest q = 0.139)
