P-Score Hierarchical Clustering Across Biomarkers (ROI-level stage-vs-rest significance)

Each panel is clustered independently, so row positions are NOT comparable between panels; the colour scale IS fixed and comparable.
Stage columns are never clustered. Rows are ordered by Euclidean/Ward clustering of the 6-D P-score profile.

No ROI x stage test reaches q < 0.05 in any biomarker (0 of 5904 cells). Clustering here groups ROIs by similarity of statistical evidence, not by biology.
