Diagnostic-Group Hierarchical Clustering Across All Four Biomarkers -- P-Scores

Each panel clusters the SIX DIAGNOSTIC GROUPS by their 246-D P-SCORE profiles (correlation distance, average linkage); columns follow that panel's leaf order, NOT the clinical order.
ROI rows are in atlas order and are NOT clustered. Branch heights are merge distances, not p-values, so no numerical branch labels are drawn.

No ROI-stage cell reaches the significance threshold in any panel: 0 of 5,904 tests at q < 0.05; the largest P-score anywhere is 0.928 < 1.301.
